

Diagram of One Possible Structuring of the Creation Days and the Creative Events of Genesis 1 & 2

Correlation with Geology and Paleontology

But now a problem arises. Does this discussion imply that the interpretation by most paleontologists of the record of the rocks as proving evolution from non-living to living material, and from living material to all the forms of living things on earth today, is a correct interpretation? Here it is important to distinguish between a Creationist interpretation of the record, and an Evolutionist interpretation of the same record. This distinction raises the question of exactly what God created, and this in turn points our attention to the need for discovering the meaning of the Biblical "kinds" which Genesis tells us God brought into being. However, this subject must be reserved for our next lecture.
